    ...   a byte alignment option add padding to the odd bytes between
structure fields.
        It is **important** for the application task reading the queue to run
at a lower priority than the **task** writing to the **queue** . Otherwise, once
an entry is posted to the **queue** , the higher-**priority** application **task**
would take over the CPU and **process** that entry. The device driver **task**
would not be able to do any more processing until the application task
blocked again to wait on the queue.
        Therefore, an application **task** with a higher **priority** than the
task writing to the queue would have the same control flow as a function
call from the device driver to the application **task** , passing the **event**
as a parameter. If the application **task** took longer than the polling
period, an **event** could possibly be missed.
        Event queue
        With the following instance, we can develop a structure...

...   a byte alignment option add padding to the odd bytes between
structure fields.

  It is **important** for the application task reading the **queue** to
run at a lower priority than the **task** writing to the **queue** . Otherwise,
once an entry is posted to the **queue** , the higher-priority application
task would take over the CPU and process that entry. The device driver
task would not be able to do any more processing until the application
task blocked again to wait on the **queue** .

  Therefore, an application **task** with a higher priority than the
task writing to the **queue** would have the same control flow as a
function call from the device driver to the application **task** , passing
the **event**   as a parameter. If the application **task** took longer than the
polling period, an **event**   could possibly be missed.

  Event queue

  With the following instance, we can develop a structure...

...   they release control, finishing or becoming blocked waiting for a
resource. Selection of the next **task** to run is based on **task**   **priority**
 assigned by the programmer , the **occurrence** of an **event** that the **task**
 is scheduled as waiting for , and the status of programmer-initiated
timing periods.
       Divvy provides...

...result of that test.
       The other major intertask communication mechanism is queued message
passing. Message **queues** can be set up, each acting as a FIFO, **queuing**
up messages for release to waiting or requesting **tasks** . **Queues** enable
processes to pass messages to other **processes** . Additionally, the **queue**

serves as a scheduling mechanism for the Divvy dispatcher model. **Tasks**
can wait for a message from a **queue** and are scheduled by priority when
the messages appear.
Divvy also supports programmable timing delays...
